

## Improving long-term

## management of diabetes

The REACTION project works to improve the daily life of diabetes patients across Europe with the aid of world class Information and Communication Technologies (ICT).

Wearable, continuous blood glucose monitoring sensors send data to professional carers and Health Information Systems via an intelligent web based platform.

The platform gives intelligent feedback to the patient on insulin therapy and risk factors and enables doctors and carers to monitor patients in order to provide the best possible treatment.

For more information, contact the project coordinator  
Lydia Montandon from Atos Origin:
